Automation of customer processes
in a robotics process automation platform

We understand Smart Automation as:

- Automation of rule-based processes by means of a robotics process automation platform
- Automated imitation of human interactions via user interfaces of IT systems – across applications and without the need to technically change existing IT systems
- Implementation in close cooperation with Clients

For our Clients:

- Relieving the employees of monotonous and repetitive activities, even with one-time actions such as data cleansing or migration
- Enhancement of quality and compliance improvement
- Productivity increase due to shorter processing times
- Cost savings and faster payback due to reduced processing costs
- Transparent and comprehensible processing – 24/7

Example: Automation of a business process
